# Field Norms

## Definition (Norm on a field)

For  $F$  a field, a function  $\|\cdot\| : F \rightarrow \mathbb{R}_{\geq 0}$  is called a field norm if the following are satisfied for all  $x, y \in F$ :

- $\|x\| = 0 \iff x = 0$  (Positive-definiteness)
- $\|xy\| = \|x\| \cdot \|y\|$  (Multiplicativity)
- $\|x + y\| \leq \|x\| + \|y\|$  (Triangle Inequality)

We call a field with a norm a *normed field*.

## Example

The absolute value with the rational numbers,  $(\mathbb{Q}, |\cdot|)$ , is a normed field.

# Cauchy Sequences and Completeness

## Theorem

The completion of a normed field is itself a normed field, with continuous extensions of the field operations,  $+$ ,  $\times$  and the norm,  $\|\cdot\|$ .

# $p$ -Adic Norm

For any  $x \in \mathbb{Q}^\times$  we can uniquely write it as

$$x = p^n \frac{a}{b}, \quad \text{where } a, b \in \mathbb{Z} \text{ and } p \nmid a \text{ or } b$$

## Definition ( $p$ -Adic Norm)

For any  $x \in \mathbb{Q}^\times$ ,  $x = p^n \frac{a}{b}$ , we define the  $p$ -adic norm of  $x$  to be  $|x|_p := \frac{1}{p^n}$ .  
For  $x = 0$ , we define  $|0|_p = 0$ .

The  $p$ -adic norm satisfies the following:

- $|x|_p = 0 \iff x = 0$  (Positive-definiteness)
- $|xy|_p = |x|_p \cdot |y|_p$  (Multiplicativity)
- $|x + y|_p \leq \max(|x|_p, |y|_p) \leq |x|_p + |y|_p$  (Strong Triangle Inequality)

## Examples

$$|27|_3 = \frac{1}{27}, \quad |9|_7 = 1, \quad \left| \frac{17 \times 3}{8} \right|_2 = 8, \quad \left| \frac{17 \times 3}{8} \right|_{17} = \frac{1}{17}, \quad |p!|_p = \frac{1}{p}$$

# $\mathbb{Q}$ is Not 7-Adically Complete

We can construct a sequence of rational numbers  $(x_n)_{n \in \mathbb{N}}$  satisfying:

1.  $x_n^2 + 3 \equiv 0 \pmod{7^n}$
2.  $x_{n+1} \equiv x_n \pmod{7^n}$

The sequence is Cauchy with respect to  $|\cdot|_7$ .

Let

$$\ell := \lim_{n \rightarrow \infty} x_n,$$

then  $\ell^2 = -3$ , so  $\ell \notin \mathbb{Q}$ .

# The $p$ -Adic Completion of $\mathbb{Q}$

## Definition

The  $p$ -adic completion of  $\mathbb{Q}$  is the  $p$ -adic numbers, denoted  $\mathbb{Q}_p$ .

## Lemma ( $p$ -adic expansion)

There is a **unique**  $p$ -adic expansion of  $x \in \mathbb{Q}_p$ :

$$x = \sum_{k=m}^{\infty} a_k p^k,$$

for some  $m \in \mathbb{Z}$  and the  $a'_k$ 's taken from a certain set of “digits”.

# Teichmüller Representatives

## Definition (Teichmüller Representatives)

The Teichmüller representatives in  $\mathbb{Q}_p$  are 0 and the  $(p - 1)$ th roots of unity in  $\mathbb{Z}_p$ . They all satisfy

$$x^p - x = 0.$$

## Remark

The Teichmüller representatives form a complete set of residues modulo  $p$ .

# The Ring of Integers and Residue Field

## Lemma

Finite extensions  $K$  of  $\mathbb{Q}_p$  are complete fields and  $|\cdot|_p$  uniquely extends to  $K$ .

## Definition

Let  $K$  be a finite extension of  $\mathbb{Q}_p$ . Then

- $\mathcal{O}_K = \{x \in K \mid |x|_p \leq 1\}$  is the **ring of integers** in  $K$ .
- $\mathfrak{m} = \{x \in K \mid |x|_p < 1\}$  is the **unique maximal ideal** in  $\mathcal{O}_K$ .
- $k = \mathcal{O}_K/\mathfrak{m}$  is the **residue field** of  $K$ .

## Examples

Taking  $K = \mathbb{Q}_p$  then:  $\mathcal{O}_K = \mathbb{Z}_p$ ,  $\mathfrak{m} = p\mathbb{Z}_p$ ,  $k = \mathcal{O}_K/\mathfrak{m} = \mathbb{Z}_p/p\mathbb{Z}_p = \mathbb{F}_p$ .

# Unramified Extensions of $\mathbb{Q}_p$

## Definition (Unramified Extension)

Let  $K/\mathbb{Q}_p$  be a finite extension, then  $k/\mathbb{F}_p$  is an extension of finite fields. We call  $K$  an **unramified** extension of  $\mathbb{Q}_p$  if  $[K : \mathbb{Q}_p] = [k : \mathbb{F}_p]$ .

## Theorem (Classification of Unramified Extensions)

Let  $K/\mathbb{Q}_p$  be an unramified extension. Then  $K = \mathbb{Q}_p(\zeta_n)$  for some  $n$  coprime to  $p$  and  $\zeta_n$  a primitive  $n$ th root of unity.

## Definition (Teichmüller Representatives in $K/\mathbb{Q}_p$ )

For  $K$  a finite extension of  $\mathbb{Q}_p$ . The elements from  $k = \mathcal{O}_K/\mathfrak{m}$  are in direct correspondence to the solutions of

$$x^q - x = 0, \quad \text{where } q = |k| = p^n.$$

These solutions are the Teichmüller representatives in  $K$ .

# Elements in a Finite Unramified Extension of $\mathbb{Q}_p$

## Theorem

For a finite unramified extension  $K$  of  $\mathbb{Q}_p$ , we can write any  $x \in K$  **uniquely** as:

$$x = \sum_{k=m}^{\infty} a_k p^k,$$

for some  $m \in \mathbb{Z}$  and where the  $a_k$ 's are Teichmüller representatives.

- 7 Conclusion and Further Study

## Krasner's Lemma

If  $\alpha, \beta \in \overline{\mathbb{Q}_p}$  and  $\beta$  is chosen closer to  $\alpha$  than any Galois conjugates of  $\alpha$ , then

$$\mathbb{Q}_p(\alpha) \subset \mathbb{Q}_p(\beta).$$

## Theorem (“Nearby” Polynomials Define the Same Extensions)

Let  $K/\mathbb{Q}_p$  be a finite extension. Let  $\alpha$  have minimal polynomial  $f(x) \in K[x]$ . Then for monic  $g(x) \in K[x]$  with “nearby” coefficients and  $\beta$  a root of  $g(x)$ . Then

$$K(\alpha) = K(\beta).$$

*Note: we can replace  $K$  with  $\mathbb{C}_p$ .*

# The Algebraic Closure of $\mathbb{Q}_p$ is Not Complete

## Theorem

$\overline{\mathbb{Q}_p}$  is not complete.

## Sketch of Proof

Consider the sequence

$$\beta_n = \sum_{i=0}^n \alpha_i p^{N_i}$$

with carefully chosen **Teichmüller representatives**  $\alpha_n$  and increasing integers  $N_i$ .

We can make it so that the sequence has the property  $\mathbb{Q}_p(\beta_n) \subset \mathbb{Q}_p(\beta)$ , where  $\beta := \sum_{i=0}^{\infty} \alpha_i p^{N_i}$ .

# The Completion of $\overline{\mathbb{Q}}_p$ is Algebraically Closed

## Definition

We denote the completion of  $\overline{\mathbb{Q}}_p$  as  $\mathbb{C}_p$ .

## Theorem

$\mathbb{C}_p$  is algebraically closed, i.e. every non-constant polynomial in  $\mathbb{C}_p[x]$  has a root in  $\mathbb{C}_p$ .

## Sketch of Proof

Use:

- $\overline{\mathbb{Q}}_p$  is dense in  $\mathbb{C}_p$
- Any root of  $g(x) \in \overline{\mathbb{Q}}_p[x]$  has all its roots in  $\overline{\mathbb{Q}}_p$
- *“Nearby” Polynomials Define the Same Extensions*

- 7 Conclusion and Further Study**

# Conclusion and Further Study

- Transcendence Degree
- $\mathbb{C}_p^{\text{unram}}/\mathbb{Q}_p$  has transcendence degree  $2^{\aleph_0} = |\mathbb{R}|$ .
- $\mathbb{C}_p/\mathbb{C}_p^{\text{unram}}$  has transcendence degree  $2^{\aleph_0}$ .
